Abstract

The totally nonnegative Grassmannian $Gr_{\geq 0}(k, n)$ is the set of k -dimensional subspaces V of \mathbb{R}^n whose nonzero Plucker coordinates all have the same sign. In their study of scattering amplitudes in $N = 4$ supersymmetric Yang-Mills theory, Arkani-Hamed and Trnka (2013) considered the image (called an amplituhedron) of $Gr_{\geq 0}(k, n)$ under a linear map $Z : \mathbb{R}^n \rightarrow \mathbb{R}^r$, where $k \leq r$ and the $r \times r$ minors of Z are all positive. One reason they required this positivity condition is to ensure that the map $Gr_{\geq 0}(k, n) \rightarrow Gr_{k, r}$ induced by Z is well defined, i.e. it takes every element of $Gr_{\geq 0}(k, n)$ to a k -dimensional subspace of \mathbb{R}^r . Lam (2015) gave a sufficient condition for the induced map $Gr_{\geq 0}(k, n) \rightarrow Gr_{k, r}$ to be well defined, in which case he called the image a Grassmann polytope. (In the case $k = 1$, Grassmann polytopes are just polytopes, and amplituhedra are cyclic polytopes.) We give a necessary and sufficient condition for the induced map $Gr_{\geq 0}(k, n) \rightarrow Gr_{k, r}$ to be well defined, in terms of sign variation. Using previous work we presented at FPSAC 2015, we obtain an equivalent condition in terms of the $r \times r$ minors of Z (assuming Z has rank r).
